Clinical Track

★ AAV Vectors Expressing LDLR Gain-of-Function Variants Demonstrate Increased Efficacy in Mouse Models of Familial Hypercholesterolemia
Suryanarayan Somanathan, Frank Jacobs, Qiang Wang, Alexandra L. Hanlon, James M. Wilson, Daniel J. Rader ................. 591

In July 2014, the average time from submission to first decision for all original research papers submitted to Circulation Research was 15 days.

On the Cover: Single human induced pluripotent stem cell–derived cardiomyocyte (hiPSC-CM) after 7 hours of infection with coxsackievirus B3 at multiplicity of infection 5. This hiPSC-CM expresses the sarcomeric protein cardiac troponin T (green) and is highly susceptible to infection by coxsackievirus, a major causative agent for viral myocarditis. Viral proteins such as the viral capsid protein VP1 (red) are rapidly expressed hours after infection in hiPSC-CMs. Nucleus is labeled with DAPI (blue). Image taken at 100x magnification and selected from Figure 2C in related article. See related article, page 556.
