In November 2014, the average time from submission to first decision for all original research papers submitted to Circulation Research was 13.96 days.

On the Cover: 3D reconstruction of an adult rat right ventricular cardiomyocyte using confocal microscopy. The cardiac myosin heavy chain is stained in red, and nuclei are stained in blue with DAPI. The right side displays the conserved secondary structure of the miR-208 microRNA precursor. The downregulation of miR-208 is believed to drive the transition from a compensated to a decompensated stage in right ventricular failure. See related article, page 56.
