In May 2017, the average time from submission to first decision for all original research papers submitted to Circulation Research was 12.3 days.

On the Cover: The cover image shows an almost confluent carpet of neutrophils in an en face view of the intimal surface of a mouse carotid artery with a neointima tailored to recapitulate features associated with human coronary arterial lesions, in a region of disturbed flow produced by a constrictive adventitial cuff. Note the multilobed nuclei characteristic of polymorphonuclear leukocytes. Green Ly6G+ fluorescence decorates the surface of these granulocytes. The article within provides evidence that such recruited neutrophils promote and amplify intimal injury and endothelial dysfunctions implicated in superficial erosion, a cause of arterial thrombosis poorly understood mechanistically. See related article, page 31.
