In July 2017, the average time from submission to first decision for all original research papers submitted to Circulation Research was 12.8 days.

On the Cover: Widespread dystrophin restoration in dystrophic mouse heart following in vivo CRISPR/Cas9 gene editing. Immunofluorescence staining showed dystrophin-positive cardiomyocytes across the entire heart section of dystrophic mice after intravenous injection of recombinant adeno-associated virus expressing CRISPR/Cas9 and gRNA. The gRNA-armed molecular scissors Cas9 are intended to cut the intron 20 and 23 of mouse dystrophin gene and remove a genomic DNA piece that carries a mutant codon in exon 23, thereby restoring dystrophin reading frame and expression. See related article, page 923.
